

Management Information Base  
for Telephony Routing over IP (TRIP)

Status of this Memo

This document specifies an Internet standards track protocol for the Internet community, and requests discussion and suggestions for improvements. Please refer to the current edition of the "Internet Official Protocol Standards" (STD 1) for the standardization state and status of this protocol. Distribution of this memo is unlimited.

Abstract

This memo defines a portion of the Management Information Base (MIB) module for use with network management protocols in the Internet community. In particular, it describes a set of managed objects that are used to manage Telephony Routing over IP (TRIP) devices.

## 1. The Internet-Standard Management Framework

For a detailed overview of the documents that describe the current Internet-Standard Management Framework, please refer to section 7 of RFC 3410 [RFC3410].

Managed objects are accessed via a virtual information store, termed the Management Information Base or MIB. MIB module objects are generally accessed through the Simple Network Management Protocol (SNMP). Objects in this MIB module are defined using the mechanisms defined in the Structure of Management Information (SMI). This memo specifies a MIB module that is compliant to the SMIV2, which is described in STD 58, RFC 2578 [RFC2578], STD 58, RFC 2579 [RFC2579], and STD 58, RFC 2580 [RFC2580].

## 2. Introduction

This memo defines a portion of the Management Information Base (MIB) for use with network management protocols in the Internet community. In particular, it describes a set of managed objects that are used to schedule management operations periodically or at specified dates and times. Since TRIP [RFC3219] is modeled after the Border Gateway Protocol (BGP-4) [RFC1771], the managed objects for TRIP are also modeled after RFC1657 - Definitions of Managed Objects for the Fourth Version of the Border Gateway Protocol (BGP-4) using SMIV2 [RFC1657].

## 3. Conventions used in this document

The key words "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT", "SHOULD", "SHOULD NOT", "RECOMMENDED", "MAY", and "OPTIONAL" in this document are to be interpreted as described in BCP 14, RFC 2119 [RFC2119].

## 4. Overview

This MIB module provides managed objects for TRIP devices defined in Telephony Routing over IP [RFC3219]. TRIP is an inter-domain application-layer control protocol that exchanges information between TRIP location servers (LS) to provide efficient IP telephony routing.

## 5. Structure of TRIP MIB

This MIB module utilizes the framework described in RFC 2788 [RFC2788] for management of multiple instances of TRIP from a single entity. The Network Services Monitoring MIB module applTable will be populated with entries corresponding to each TRIP Location Server

in the system. Each TRIP Location Server will then have an `applIndex` associated with it. The value assigned to `applIndex` will represent the distinct instance of TRIP.

The TRIP MIB module contains the following groups of objects with each group as part of the management of a singular TRIP entity. Each group covers a section of functionality of TRIP:

- o The `tripConfigGroup` contains the common configuration objects applicable to all TRIP applications referenced by the `applIndex`.
- o The `tripPeerTableConfigGroup` contains the configuration objects applicable to all TRIP peers of the Location Server referenced by the `applIndex`.
- o The `tripRouteGroup` contains the configuration objects related to the routes of all TRIBs of this Location Server.
- o The `tripItadTopologyGroup` contains information about the topology of the TRIP ITADs concerning this Location Server.
- o The `tripPeerTableStatsGroup` contains the statistical objects applicable to all TRIP peers of the Location Server referenced by the `applIndex`.
- o The `tripNotificationGroup` contains notifications that the TRIP application can generate.
- o The `tripNotifObjectGroup` contains the objects needed by one or more of the notifications.

### 5.1. Textual Conventions

The data types `TripItad` and `TripId` are used as textual conventions in this document. A TRIP ITAD (IP Telephony Administrative Domain) is described in [RFC3219]. A TRIP ID is used as a distinct identifier for a TRIP Location Server. A `TripAppProtocol` is used to identify an application protocol. A `TripAddressFamily` is used to define an address family. `TripCommunityId` is used as a distinct identifier for a TRIP community. `TripProtocolVersion` depicts the version number of the TRIP protocol. `TripSendReceiveMode` describes the operational mode of the TRIP application.

    SYNTAX      InetPortNumber
    MAX-ACCESS   read-only
    STATUS       current
    DESCRIPTION
        "The port of the next hop server that this route
        will use."
    ::= { tripRouteEntry 10 }

tripRouteNextHopServerItad OBJECT-TYPE
    SYNTAX      TripItad
    MAX-ACCESS   read-only
    STATUS       current
    DESCRIPTION
        "Indicates the domain of the next hop."
    ::= { tripRouteEntry 11 }

tripRouteMultiExitDisc OBJECT-TYPE
    SYNTAX      Unsigned32 (0..4294967295)
    MAX-ACCESS   read-only
    STATUS       current
    DESCRIPTION
        "The Multiple Exit Discriminator allows an LS to
        discriminate between, and indicate preference for,
        otherwise similar routes to a neighbouring domain.
        A higher value represents a more preferred routing
        object."
```

## REFERENCE

"RFC 3219, section 5.8"

::= { tripRouteEntry 12 }

## tripRouteLocalPref OBJECT-TYPE

SYNTAX Unsigned32 (0..4294967295)

MAX-ACCESS read-only

STATUS current

## DESCRIPTION

"Indicated the local LS's degree of preference for an advertised route destination."

## REFERENCE

"RFC 3219, section 4.3.4.7"

::= { tripRouteEntry 13 }

## tripRouteAdvertisementPath OBJECT-TYPE

SYNTAX OCTET STRING (SIZE(4..252))

MAX-ACCESS read-only

STATUS current

## DESCRIPTION

"Identifies the sequence of domains through which this advertisement has passed."

This object is probably best represented as sequence of TripItads. For SMI compatibility, though, it is represented as an OCTET STRING. This object is a sequence of ITADs where each set of 4 octets corresponds to a TRIP ITAD in network byte order."

## REFERENCE

"RFC 3219, section 4.3.4.4"

::= { tripRouteEntry 14 }

## tripRouteRoutedPath OBJECT-TYPE

SYNTAX OCTET STRING (SIZE(4..252))

MAX-ACCESS read-only

STATUS current

## DESCRIPTION

"Identifies the ITADs through which messages sent using this route would pass. These are a subset of tripRouteAdvertisementPath."

This object is probably best represented as sequence of TripItads. For SMI compatibility, though, it is represented as OCTET STRING. This object is a sequence of ITADs where each set of 4 octets corresponds to a TRIP ITAD in network byte order."

## REFERENCE

"RFC 3219, section 4.3.4.5"

```
::= { tripRouteEntry 15 }
```

tripRouteAtomicAggregate OBJECT-TYPE

SYNTAX TruthValue

MAX-ACCESS read-only

STATUS current

DESCRIPTION

"Indicates that a route MAY traverse domains not listed in tripRouteRoutedPath. If an LS selects the less specific route from a set of overlapping routes, then this value returns TRUE."

REFERENCE

"RFC 3219, section 4.3.4.6"

```
::= { tripRouteEntry 16 }
```

tripRouteUnknown OBJECT-TYPE

SYNTAX OCTET STRING (SIZE(0..255))

MAX-ACCESS read-only

STATUS current

DESCRIPTION

"This object contains one or more attributes that were not understood, and because they were transitive, were dropped during aggregation. They take the format of a triple <attribute type, attribute length, attribute value>, of variable length. If no attributes were dropped, this returns an OCTET STRING of size 0."

## 7. Security Considerations

The managed objects in this MIB module contain sensitive information since, collectively, they allow tracing and influencing of connections in TRIP devices and provide information of their connection characteristics. As such, improper manipulation of the objects represented by this MIB module MAY result in denial of service to a large number of available routes.

There are a number of management objects defined in this MIB module that have a MAX-ACCESS clause of read-write and/or read-create. Such objects MAY be considered sensitive or vulnerable in some network environments. The support for SET operations in a non-secure environment without proper protection can have a negative effect on network operations. These objects include:

**tripCfgItad:**

Improper setting of tripCfgItad value can make all peer connections drop and not be re-established.

**tripCfgAdminStatus:**

Improper setting of tripCfgAdminStatus from up to down will cause the TRIP Location Server stop processing TRIP messages.

**tripCfgPort:**

Improper setting of tripCfgPort can cause the failure of a peer establishing a connection.

**tripCfgMinItadOriginationInterval,  
tripCfgMinRouteAdvertisementInterval:**

Improper configuration of these values MAY adversely affect local and global convergence of the routes advertised by this TRIP Location Server.

**tripPeerAdminStatus:**

Improper setting of tripPeerAdminStatus from up to down can cause significant disruption of the connectivity to the destination via the applicable remote TRIP Location Server peer.

**tripPeerConnectRetryInterval,tripPeerMaxRetryInterval:**

Improper configuration of these values can cause connections to be disrupted for extremely long time periods when otherwise they would be restored in a relatively short period of time.

**tripPeerHoldTimeConfigured, tripPeerKeepAliveConfigured:**

Improper configuration of these value can make TRIP peer sessions more fragile and less resilient to denial of service attacks.

There are a number of managed objects in this MIB module that contain sensitive information regarding the operation of a network. For example, a TRIP Location Server peer's local and remote addresses might be sensitive for ISPs who want to keep interface addresses on TRIP Location Server confidential so as to prevent TRIP Location Server addresses used for a denial of service attack or address spoofing.

Therefore, it is thus important to control even GET access to these objects and possibly to even encrypt the values of these object when sending them over the network via SNMP. Not all versions of SNMP provide features for such a secure environment.

SNMPv1 by itself is not a secure environment. Even if the network itself is secure (for example by using IPSec), even then, there is no control as to who on the secure network is allowed to access and GET/SET (read/change/create/delete) the objects in this MIB module.

It is RECOMMENDED that the implementers consider the security features as provided by the SNMPv3 framework (see [RFC3410], section 8), including full support for the SNMPv3 cryptographic mechanisms (for authentication and privacy).

Further, deployment of SNMP versions prior to SNMPv3 is NOT RECOMMENDED. Instead, it is RECOMMENDED to deploy SNMPv3 and to enable cryptographic security. It is then a customer/operator responsibility to ensure that the SNMP entity giving access to an instance of this MIB module is properly configured to give access to the objects only to those principals (users) that have legitimate rights to indeed GET or SET (change/create/delete) them.
