1 util-vserver (libvserver) Module Index

1.1 util-vserver (libvserver) Modules

Here is a list of all modules:

Syscall wrappers	2
Helper functions	8

2 util-vserver (libvserver) Data Structure Index

2.1 util-vserver (libvserver) Data Structures

Here are the data structures with brief descriptions:

Mapping_uint32	10
Mapping_uint64	10
vc_ctx_caps (Capabilities of process-contexts)	11
vc_ctx_dlimit	11
vc_ctx_flags (Flags of process-contexts)	12
vc_ctx_stat (Statistics about a context)	12
vc_err_listparser (Information about parsing errors)	13
vc_ip_mask_pair	13
vc_net_caps	14
vc_net_flags	14

vc_net_nx	14
vc_nx_info	14
vc_rlimit (The limits of a resources)	15
vc_rlimit_mask (Masks describing the supported limits)	15
vc_rlimit_stat (Statistics for a resource limit)	16
vc_set_sched	16
vc_virt_stat (Contains further statistics about a context)	17
vc_vx_info	17

3 util-vserver (libvserver) File Index

3.1 util-vserver (libvserver) File List

Here is a list of all documented files with brief descriptions:

internal.h (Declarations which are used by util-vserver internally)	18
vserver.h (The public interface of the the libvserver library)	19

4 util-vserver (libvserver) Module Documentation

4.1 Syscall wrappers

Functions

- [int vc_syscall](#) (uint32_t cmd, [xid_t](#) xid, void *data)
The generic vserver syscall.
- [int vc_get_version](#) ()
Returns the version of the current kernel API.
- [int vc_get_vci](#) ()
Returns the kernel configuration bits.
- [xid_t vc_new_s_context](#) ([xid_t](#) ctx, unsigned int remove_cap, unsigned int flags)
Moves current process into a context.
- [int vc_set_ipv4root](#) (uint32_t bcast, size_t nb, struct [vc_ip_mask_pair](#) const *ips)
Sets the ipv4root information.
- [xid_t vc_ctx_create](#) ([xid_t](#) xid)
Creates a context without starting it.

- `int vc_ctx_migrate (xid_t xid)`
Moves the current process into the specified context.
- `int vc_ctx_stat (xid_t xid, struct vc_ctx_stat *stat)`
Get some statistics about a context.
- `int vc_virt_stat (xid_t xid, struct vc_virt_stat *stat)`
Get more statistics about a context.
- `int vc_get_rlimit (xid_t xid, int resource, struct vc_rlimit *lim)`
Returns the limits of resource.
- `int vc_set_rlimit (xid_t xid, int resource, struct vc_rlimit const *lim)`
Sets the limits of resource.
- `int vc_rlimit_stat (xid_t xid, int resource, struct vc_rlimit_stat *stat)`
Returns the current stats of resource.
- `int vc_reset_minmax (xid_t xid)`
Resets the minimum and maximum observed values for all resources.
- `int vc_ctx_kill (xid_t ctx, pid_t pid, int sig)`
Sends a signal to a context/pid.
- `int vc_get_iattr (char const *filename, xid_t *xid, uint_least32_t *flags, uint_least32_t *mask)`
Returns information about attributes and assigned context of a file.
- `xid_t vc_get_task_xid (pid_t pid)`
Returns the context of the given process.
- `xid_t vc_getfilecontext (char const *filename)`
Returns the context of filename.
- `int vc_wait_exit (xid_t xid)`
Waits for the end of a context.

4.1.1 Detailed Description

Functions which are calling the vserver syscall directly.

4.1.2 Function Documentation

4.1.2.1 `xid_t vc_ctx_create (xid_t xid)`

Creates a context without starting it.

This functions initializes a new context. When already in a freshly created context, this old context will be discarded.

Parameters:

xid The new context; special values are:

- VC_DYNAMIC_XID which means to create a dynamic context

Returns:

the xid of the created context, or VC_NOCTX on errors. `errno` will be set appropriately.

4.1.2.2 int vc_ctx_kill (xid_t ctx, pid_t pid, int sig)

Sends a signal to a context/pid.

Special values for *pid* are:

- -1 which means every process in ctx except the init-process
- 0 which means every process in ctx inclusive the init-process

4.1.2.3 int vc_ctx_migrate (xid_t xid)

Moves the current process into the specified context.

Parameters:

xid The new context

Returns:

0 on success, -1 on errors

4.1.2.4 int vc_ctx_stat (xid_t xid, struct vc_ctx_stat * stat)

Get some statistics about a context.

Parameters:

xid The context to get stats about

stat Where to store the result

Returns:

0 on success, -1 on errors.

4.1.2.5 int vc_get_iattr (char const * filename, xid_t * xid, uint_least32_t * flags, uint_least32_t * mask)

Returns information about attributes and assigned context of a file.

This function returns the VC_IATTR_XXX flags and about the assigned context of a file. To request an information, the appropriate bit in *mask* must be set and the corresponding parameter (*xid* or *flags*) must not be NULL.

E.g. to receive the assigned context, the VC_IATTR_XID bit must be set in *mask*, and *xid* must point to valid memory.

Possible flags are VC_IATTR_ADMIN, VC_IATTR_WATCH, VC_IATTR_HIDE, VC_IATTR_BARRIER, VC_IATTR_IUNLINK and VC_IATTR_IMMUTABLE.

Parameters:

filename The name of the file whose attributes shall be determined.

xid When non-zero and the VC_IATTR_XID bit is set in *mask*, the assigned context of *filename* will be stored there.

flags When non-zero, a bitmask of current attributes will be stored there. These attributes must be requested explicitly by setting the appropriate bit in *mask*

mask Points to a bitmask which tells which attributes shall be determined. On return, it will masquerade the attributes which were determined.

Precondition:

```
mask!=0 && !((*mask&VC_IATTR_XID) && xid==0) && !((*mask&~VC_IATTR_XID) &&
flags==0)
```

4.1.2.6 int vc_get_rlimit (xid_t xid, int resource, struct vc_rlimit * lim)

Returns the limits of *resource*.

Parameters:

xid The id of the context

resource The resource which will be queried

lim The result which will be filled with the limits

Returns:

0 on success, and -1 on errors.

4.1.2.7 xid_t vc_get_task_xid (pid_t pid)

Returns the context of the given process.

Parameters:

pid the process-id whose xid shall be determined; pid==0 means the current process.

Returns:

the xid of process *pid* or -1 on errors

4.1.2.8 int vc_get_vci ()

Returns the kernel configuration bits.

Returns:

The kernel configuration bits

4.1.2.9 int vc_get_version ()

Returns the version of the current kernel API.

Returns:

The versionnumber of the kernel API

4.1.2.10 `xid_t vc_getfilecontext (char const *filename)`

Returns the context of *filename*.

This function calls `vc_get_iattr()` with appropriate arguments to determine the context of *filename*. In error-case or when no context is assigned, `VC_NOCTX` will be returned. To differ between both cases, `errno` must be examined.

WARNING: this function can modify `errno` although no error happened.

Parameters:

filename The file to check

Returns:

The assigned context, or `VC_NOCTX` when an error occurred or no such assignment exists. `errno` will be 0 in the latter case

4.1.2.11 `xid_t vc_new_s_context (xid_t ctx, unsigned int remove_cap, unsigned int flags)`

Moves current process into a context.

Puts current process into context *ctx*, removes the capabilities given in *remove_cap* and sets *flags*.

Parameters:

ctx The new context; special values for are

- `VC_SAMECTX` which means the current context (just for changing caps and flags)
- `VC_DYNAMIC_XID` which means the next free context; this value can be used by ordinary users also

remove_cap The linux capabilities which will be **removed**.

flags Special flags which will be set.

Returns:

The new context-id, or `VC_NOCTX` on errors; `errno` will be set appropriately

See <http://vserver.13thfloor.at/Stuff/Logic.txt> for details

4.1.2.12 `int vc_reset_minmax (xid_t xid)`

Resets the minimum and maximum observed values for all resources.

Parameters:

xid The id of the context

Returns:

0 on success, and -1 on errors.

4.1.2.13 `int vc_rlimit_stat (xid_t xid, int resource, struct vc_rlimit_stat * stat)`

Returns the current stats of *resource*.

Parameters:

xid The id of the context

resource The resource which will be queried

stat The result which will be filled with the stats

Returns:

0 on success, and -1 on errors.

4.1.2.14 `int vc_set_ipv4root (uint32_t bcast, size_t nb, struct vc_ip_mask_pair const * ips)`

Sets the ipv4root information.

Precondition:

$nb < \text{NB_IPV4ROOT}$ && $ips \neq 0$

4.1.2.15 `int vc_set_rlimit (xid_t xid, int resource, struct vc_rlimit const * lim)`

Sets the limits of *resource*.

Parameters:

xid The id of the context

resource The resource which will be queried

lim The new limits

Returns:

0 on success, and -1 on errors.

4.1.2.16 `int vc_syscall (uint32_t cmd, xid_t xid, void * data)`

The generic vserver syscall.

This function executes the generic vserver syscall. It uses the correct syscallnumber (which may differ between the different architectures).

Parameters:

cmd the command to be executed

xid the xid on which the cmd shall be applied

data additional arguments; depends on *cmd*

Returns:

depends on *cmd*; usually, -1 stands for an error

4.1.2.17 int `vc_virt_stat` (`xid_t` *xid*, struct `vc_virt_stat` * *stat*)

Get more statistics about a context.

Parameters:

- xid* The context to get stats about
- stat* Where to store the result

Returns:

0 on success, -1 on errors.

4.2 Helper functions

Data Structures

- struct `vc_err_listparser`
Information about parsing errors.

Functions

- `size_t` `vc_get_nb_ipv4root` () VC_ATTR_CONST
Returns the value of NB_IPV4ROOT.
- `bool` `vc_parseLimit` (char const *str, `vc_limit_t` *res)
Parses a string describing a limit.
- `uint_least64_t` `vc_text2bcap` (char const *str, `size_t` len)
Converts a single string into bcapability.
- char const * `vc_lobcap2text` (`uint_least64_t` *val)
Converts the lowest bit of a bcapability or the entire value (when possible) to a textual representation.
- `int` `vc_list2bcap` (char const *str, `size_t` len, struct `vc_err_listparser` *err, struct `vc_ctx_caps` *cap)
Converts a string into a bcapability-bitmask.

4.2.1 Detailed Description

Functions which are doing general helper tasks like parameter parsing.

4.2.2 Function Documentation

4.2.2.1 `size_t` `vc_get_nb_ipv4root` ()

Returns the value of NB_IPV4ROOT.

This function returns the value of NB_IPV4ROOT which was used when the library was built, but **not** the value which is used by the currently running kernel.

4.2.2.2 `int vc_list2bcap (char const * str, size_t len, struct vc_err_listparser * err, struct vc_ctx_caps * cap)`

Converts a string into a bcapability-bitmask.

Syntax of *str*: list2xxx.syntax

When the '~' prefix is used, the bits will be unset and a '~' after another '~' will cancel both ones. The '^' prefix specifies a bitnumber instead of a bitmask.

"literal name" is everything which will be accepted by the `vc_text2bcap()` function. The special values for NAME will be recognized case insensitively

Parameters:

str The string to be parsed

len The length of the string, or 0 for automatic detection

err Pointer to a structure for error-information, or NULL.

cap Pointer to a `vc_ctx_caps` structure holding the results; only the *bcaps* and *bmask* fields will be changed and already set values will not be honored. When an error occurred, *cap* will have the value of all processed valid BCAP parts.

Returns:

0 on success, -1 on error. In error case, *err* will hold position and length of the first not understood BCAP part

Precondition:

str != 0 && *cap* != 0; *cap*->*bcaps* and *cap*->*bmask* must be initialized

4.2.2.3 `char const* vc_lobcap2text (uint_least64_t * val)`

Converts the lowest bit of a bcapability or the entire value (when possible) to a textual representation.

Parameters:

val The string to be converted; on success, the detected bit(s) will be unset, in errorcase only the lowest set bit

Returns:

A textual representation of *val* resp. of its lowest set bit; or NULL in errorcase.

Precondition:

val != 0

Postcondition:

**val_{old}* != 0 <-> **val_{old}* > **val_{new}*
**val_{old}* == 0 --> *result* == 0

4.2.2.4 bool vc_parseLimit (char const * *str*, vc_limit_t * *res*)

Parses a string describing a limit.

This function parses *str* and interprets special words like "inf" or suffixes. Valid suffixes are

- k ... 1000
- m ... 1000000
- K ... 1024
- M ... 1048576

Parameters:

str The string which shall be parsed

res Will be filled with the interpreted value; in errorcase, this value is undefined.

Returns:

true, iff the string *str* could be parsed. *res* will be filled with the interpreted value in this case.

Precondition:

str!=0 && *res*!=0

4.2.2.5 uint_least64_t vc_text2bcap (char const * *str*, size_t *len*)

Converts a single string into bcapability.

Parameters:

str The string to be parsed; both "CAP_XXX" and "XXX" will be accepted

len The length of the string, or 0 for automatic detection

Returns:

0 on error; a bitmask on success

Precondition:

str != 0

5 util-vserver (libvserver) Data Structure Documentation

5.1 Mapping_uint32 Struct Reference

Data Fields

- char const *const *id*
- size_t *len*
- uint_least32_t *val*

5.1.1 Detailed Description

Definition at line 62 of file internal.h.

The documentation for this struct was generated from the following file:

5.2.1 Detailed Description

Definition at line 68 of file internal.h.

The documentation for this struct was generated from the following file:

- [internal.h](#)

5.3 vc_ctx_caps Struct Reference

Capabilities of process-contexts.

```
#include <vserver.h>
```

Data Fields

- uint_least64_t [bcaps](#)
Mask of set common system capabilities.
- uint_least64_t [bmask](#)
Mask of set and unset common system capabilities when used by set operations, or the modifiable capabilities when used by get operations.
- uint_least64_t [ccaps](#)
Mask of set process context capabilities.
- uint_least64_t [cmask](#)
Mask of set and unset process context capabilities when used by set operations, or the modifiable capabilities when used by get operations.

5.3.1 Detailed Description

Capabilities of process-contexts.

Definition at line 648 of file `vserver.h`.

The documentation for this struct was generated from the following file:

- [vserver.h](#)

5.4 `vc_ctx_dlimit` Struct Reference

Data Fields

- `uint_least32_t` [space_used](#)
- `uint_least32_t` [space_total](#)
- `uint_least32_t` [inodes_used](#)
- `uint_least32_t` [inodes_total](#)
- `uint_least32_t` [reserved](#)

5.4.1 Detailed Description

Definition at line 825 of file `vserver.h`.

The documentation for this struct was generated from the following file:

- [vserver.h](#)

5.5 `vc_ctx_flags` Struct Reference

Flags of process-contexts.

```
#include <vserver.h>
```

Data Fields

- `uint_least64_t` [flagword](#)
Mask of set context flags.
- `uint_least64_t` [mask](#)
Mask of set and unset context flags when used by set operations, or modifiable flags when used by get operations.

5.5.1 Detailed Description

Flags of process-contexts.

Definition at line 638 of file `vserver.h`.

The documentation for this struct was generated from the following file:

- [vserver.h](#)

5.6 vc_ctx_stat Struct Reference

Statistics about a context.

```
#include <vserver.h>
```

Data Fields

- `uint_least32_t usecnt`
number of uses
- `uint_least32_t tasks`
number of tasks

5.6.1 Detailed Description

Statistics about a context.

Definition at line 383 of file `vserver.h`.

The documentation for this struct was generated from the following file:

- [vserver.h](#)

5.7 vc_err_listparser Struct Reference

Information about parsing errors.

```
#include <vserver.h>
```

Data Fields

- `char const * ptr`
Pointer to the first character of an erroneous string.
- `size_t len`
Length of the erroneous string.

5.7.1 Detailed Description

Information about parsing errors.

Definition at line 666 of file `vserver.h`.

The documentation for this struct was generated from the following file:

- [vserver.h](#)

5.8 `vc_ip_mask_pair` Struct Reference

Data Fields

- `uint32_t ip`
- `uint32_t mask`

5.8.1 Detailed Description

Definition at line 298 of file `vserver.h`.

The documentation for this struct was generated from the following file:

- [vserver.h](#)

5.9 `vc_net_caps` Struct Reference

Data Fields

- `uint_least64_t ncaps`
- `uint_least64_t cmask`

5.9.1 Detailed Description

Definition at line 558 of file `vserver.h`.

The documentation for this struct was generated from the following file:

- [vserver.h](#)

5.10 `vc_net_flags` Struct Reference

Data Fields

- `uint_least64_t flagword`
- `uint_least64_t mask`

5.10.1 Detailed Description

Definition at line 549 of file `vserver.h`.

The documentation for this struct was generated from the following file:

- [vserver.h](#)

5.11 `vc_net_nx` Struct Reference

Data Fields

- `vc_net_nx_type type`

- [size_t count](#)
- [uint32_t ip](#) [4]
- [uint32_t mask](#) [4]

5.11.1 Detailed Description

Definition at line 536 of file `vserver.h`.

The documentation for this struct was generated from the following file:

- [vserver.h](#)

5.12 `vc_nx_info` Struct Reference

Data Fields

- [nid_t nid](#)

5.12.1 Detailed Description

Definition at line 525 of file `vserver.h`.

The documentation for this struct was generated from the following file:

- [vserver.h](#)

5.13 `vc_rlimit` Struct Reference

The limits of a resources.

```
#include <vserver.h>
```

Data Fields

- [vc_limit_t min](#)
the guaranted minimum of a resources
- [vc_limit_t soft](#)
the softlimit of a resource
- [vc_limit_t hard](#)
the absolute hardlimit of a resource

5.13.1 Detailed Description

The limits of a resources.

This is a triple consisting of a minimum, soft and hardlimit.

Definition at line 434 of file `vserver.h`.

The documentation for this struct was generated from the following file:

- [vserver.h](#)

5.14 `vc_rlimit_mask` Struct Reference

Masks describing the supported limits.

```
#include <vserver.h>
```

Data Fields

- `uint_least32_t` [min](#)
masks the resources supporting a minimum limit
- `uint_least32_t` [soft](#)
masks the resources supporting a soft limit
- `uint_least32_t` [hard](#)
masks the resources supporting a hard limit

5.14.1 Detailed Description

Masks describing the supported limits.

Definition at line 441 of file `vserver.h`.

The documentation for this struct was generated from the following file:

- [vserver.h](#)

5.15 `vc_rlimit_stat` Struct Reference

Statistics for a resource limit.

```
#include <vserver.h>
```

Data Fields

- `uint_least32_t` [hits](#)
number of hits on the limit
- `uint_least64_t` [value](#)
current value
- `uint_least64_t` [minimum](#)
minimum value observed
- `uint_least64_t` [maximum](#)
maximum value observed

5.15.1 Detailed Description

Statistics for a resource limit.

Definition at line 448 of file vserver.h.

The documentation for this struct was generated from the following file:

- [vserver.h](#)

5.16 vc_set_sched Struct Reference

Data Fields

- [uint_least32_t set_mask](#)
- [int_least32_t fill_rate](#)
- [int_least32_t interval](#)
- [int_least32_t fill_rate2](#)
- [int_least32_t interval2](#)
- [int_least32_t tokens](#)
- [int_least32_t tokens_min](#)
- [int_least32_t tokens_max](#)
- [int_least32_t priority_bias](#)
- [int_least32_t cpu_id](#)
- [int_least32_t bucket_id](#)

5.16.1 Detailed Description

Definition at line 808 of file vserver.h.

The documentation for this struct was generated from the following file:

- [vserver.h](#)

5.17 vc_virt_stat Struct Reference

Contains further statistics about a context.

```
#include <vserver.h>
```

Data Fields

- [uint_least64_t offset](#)
- [uint_least32_t uptime](#)
- [uint_least32_t nr_threads](#)
- [uint_least32_t nr_running](#)
- [uint_least32_t nr_uninterruptible](#)
- [uint_least32_t nr_onhold](#)
- [uint_least32_t nr_forks](#)
- [uint_least32_t load](#) [3]

5.17.1 Detailed Description

Contains further statistics about a context.

Definition at line 398 of file vserver.h.

The documentation for this struct was generated from the following file:

- [vserver.h](#)

5.18 vc_vx_info Struct Reference

Data Fields

- [xid_t](#) xid
- [pid_t](#) initpid

5.18.1 Detailed Description

Definition at line 602 of file vserver.h.

The documentation for this struct was generated from the following file:

- [vserver.h](#)

6 util-vserver (libvserver) File Documentation

6.1 internal.h File Reference

Declarations which are used by util-vserver internally.

Typedefs

- typedef an_unsigned_integer_type `xid_t`
- typedef an_unsigned_integer_type `nid_t`
- typedef uint_least64_t `vc_limit_t`

The type which is used for a single limit value.

Enumerations

- enum [vc_net_nx_type](#) {
`vcNET_IPV4 = 1, vcNET_IPV6 = 2, vcNET_IPV4B = 0x101, vcNET_IPV6B = 0x102,`
`vcNET_ANY = ~0 }`
- enum [vc_uts_type](#) {
`vcVHI_CONTEXT, vcVHI_SYSNAME, vcVHI_NODENAME, vcVHI_RELEASE,`
`vcVHI_VERSION, vcVHI_MACHINE, vcVHI_DOMAINNAME }`
- enum [vcFeatureSet](#) {
`vcFEATURE_VKILL, vcFEATURE_IATTR, vcFEATURE_RLIMIT, vcFEATURE_-`
`COMPAT,`
`vcFEATURE_MIGRATE, vcFEATURE_NAMESPACE, vcFEATURE_SCHED, vc-`
`FEATURE_VINFO,`
`vcFEATURE_VHI, vcFEATURE_VSHELPER0, vcFEATURE_VSHELPER, vcFEATURE_-`
`VWAIT,`
`vcFEATURE_VNET }`
- enum [vcXidType](#) {
`vcTYPE_INVALID, vcTYPE_MAIN, vcTYPE_WATCH, vcTYPE_STATIC,`
`vcTYPE_DYNAMIC }`
- enum [vcCfgStyle](#) {
`vcCFG_NONE, vcCFG_AUTO, vcCFG_LEGACY, vcCFG_RECENT_SHORT,`
`vcCFG_RECENT_FULL }`

Functions

- int [vc_syscall](#) (uint32_t cmd, [xid_t](#) xid, void *data)
The generic vserver syscall.
- int [vc_get_version](#) ()
Returns the version of the current kernel API.
- int [vc_get_vci](#) ()
Returns the kernel configuration bits.
- [xid_t](#) [vc_new_s_context](#) ([xid_t](#) ctx, unsigned int remove_cap, unsigned int flags)
Moves current process into a context.
- int [vc_set_ipv4root](#) (uint32_t bcast, size_t nb, struct [vc_ip_mask_pair](#) const *ips)
Sets the ipv4root information.
- size_t [vc_get_nb_ipv4root](#) () VC_ATTR_CONST
Returns the value of NB_IPV4ROOT.
- [xid_t](#) [vc_ctx_create](#) ([xid_t](#) xid)
Creates a context without starting it.
- int [vc_ctx_migrate](#) ([xid_t](#) xid)

Moves the current process into the specified context.

- `int vc_ctx_stat (xid_t xid, struct vc_ctx_stat *stat)`
Get some statistics about a context.
- `int vc_virt_stat (xid_t xid, struct vc_virt_stat *stat)`
Get more statistics about a context.
- `int vc_get_rlimit (xid_t xid, int resource, struct vc_rlimit *lim)`
Returns the limits of resource.
- `int vc_set_rlimit (xid_t xid, int resource, struct vc_rlimit const *lim)`
Sets the limits of resource.
- `int vc_get_rlimit_mask (xid_t xid, struct vc_rlimit_mask *lim)`
- `int vc_rlimit_stat (xid_t xid, int resource, struct vc_rlimit_stat *stat)`
Returns the current stats of resource.
- `int vc_reset_minmax (xid_t xid)`
Resets the minimum and maximum observed values for all resources.
- `bool vc_parseLimit (char const *str, vc_limit_t *res)`
Parses a string describing a limit.
- `int vc_ctx_kill (xid_t ctx, pid_t pid, int sig)`
Sends a signal to a context/pid.
- `nid_t vc_get_task_nid (pid_t pid)`
- `int vc_get_nx_info (nid_t nid, struct vc_nx_info *)`
- `nid_t vc_net_create (nid_t nid)`
- `int vc_net_migrate (nid_t nid)`
- `int vc_net_add (nid_t nid, struct vc_net_nx const *info)`
- `int vc_net_remove (nid_t nid, struct vc_net_nx const *info)`
- `int vc_get_nflags (nid_t, struct vc_net_flags *)`
- `int vc_set_nflags (nid_t, struct vc_net_flags const *)`
- `int vc_get_ncaps (nid_t, struct vc_net_caps *)`
- `int vc_set_ncaps (nid_t, struct vc_net_caps const *)`
- `int vc_set_iattr (char const *filename, xid_t xid, uint_least32_t flags, uint_least32_t mask)`
- `int vc_get_iattr (char const *filename, xid_t *xid, uint_least32_t *flags, uint_least32_t *mask)`
Returns information about attributes and assigned context of a file.
- `xid_t vc_get_task_xid (pid_t pid)`
Returns the context of the given process.
- `int vc_get_vx_info (xid_t xid, struct vc_vx_info *info)`
- `int vc_set_vhi_name (xid_t xid, vc_uts_type type, char const *val, size_t len)`
- `int vc_get_vhi_name (xid_t xid, vc_uts_type type, char *val, size_t len)`
- `bool vc_is_dynamic_xid (xid_t xid)`
- `int vc_enter_namespace (xid_t xid, uint_least64_t mask)`
- `int vc_set_namespace (xid_t xid, uint_least64_t mask)`

- `int vc_cleanup_namespace ()`
- `uint_least64_t vc_get_space_mask ()`
- `int vc_get_cflags (xid_t xid, struct vc_ctx_flags *)`
- `int vc_set_cflags (xid_t xid, struct vc_ctx_flags const *)`
- `int vc_get_ccaps (xid_t xid, struct vc_ctx_caps *)`
- `int vc_set_ccaps (xid_t xid, struct vc_ctx_caps const *)`
- `uint_least64_t vc_text2bcap (char const *str, size_t len)`
Converts a single string into bcapability.
- `char const * vc_lobcap2text (uint_least64_t *val)`
Converts the lowest bit of a bcapability or the entire value (when possible) to a textual representation.
- `int vc_list2bcap (char const *str, size_t len, struct vc_err_listparser *err, struct vc_ctx_caps *cap)`
Converts a string into a bcapability-bitmask.
- `uint_least64_t vc_text2ccap (char const *, size_t len)`
- `char const * vc_loccap2text (uint_least64_t *)`
- `int vc_list2ccap (char const *, size_t len, struct vc_err_listparser *err, struct vc_ctx_caps *)`
- `int vc_list2cflag (char const *, size_t len, struct vc_err_listparser *err, struct vc_ctx_flags *flags)`
- `uint_least64_t vc_text2cflag (char const *, size_t len)`
- `char const * vc_locflag2text (uint_least64_t *)`
- `uint_least32_t vc_list2cflag_compat (char const *, size_t len, struct vc_err_listparser *err)`
- `uint_least32_t vc_text2cflag_compat (char const *, size_t len)`
- `char const * vc_hicflag2text_compat (uint_least32_t)`
- `int vc_text2cap (char const *)`
- `char const * vc_cap2text (unsigned int)`
- `int vc_list2nflag (char const *, size_t len, struct vc_err_listparser *err, struct vc_net_flags *flags)`
- `uint_least64_t vc_text2nflag (char const *, size_t len)`
- `char const * vc_lonflag2text (uint_least64_t *)`
- `uint_least64_t vc_text2ncap (char const *, size_t len)`
- `char const * vc_loncap2text (uint_least64_t *)`
- `int vc_list2ncap (char const *, size_t len, struct vc_err_listparser *err, struct vc_net_caps *)`
- `uint_least64_t vc_get_insecurebcaps () VC_ATTR_CONST`
- `uint_least32_t vc_text2personalityflag (char const *str, size_t len)`
- `char const * vc_lopersonality2text (uint_least32_t *)`
- `int vc_list2personalityflag (char const *, size_t len, uint_least32_t *personality, struct vc_err_listparser *err)`
- `uint_least32_t vc_str2personalitytype (char const *, size_t len)`
- `xid_t vc_getfilecontext (char const *filename)`
Returns the context of filename.
- `int vc_set_sched (xid_t xid, struct vc_set_sched const *)`
- `int vc_add_dlimit (char const *filename, xid_t xid, uint_least32_t flags)`
- `int vc_rem_dlimit (char const *filename, xid_t xid, uint_least32_t flags)`
- `int vc_set_dlimit (char const *filename, xid_t xid, uint_least32_t flags, struct vc_ctx_dlimit const *limits)`
- `int vc_get_dlimit (char const *filename, xid_t xid, uint_least32_t flags, struct vc_ctx_dlimit *limits)`
- `int vc_wait_exit (xid_t xid)`
Waits for the end of a context.

- `bool vc_isSupported (vcFeatureSet) VC_ATTR_CONST`
- `bool vc_isSupportedString (char const *)`
- `vcXidType vc_getXIDType (xid_t xid) VC_ATTR_CONST`
- `xid_t vc_xidopt2xid (char const *, bool honor_static, char const **err_info)`
- `nid_t vc_nidopt2nid (char const *, bool honor_static, char const **err_info)`
- `vcCfgStyle vc_getVserverCfgStyle (char const *id)`
- `char * vc_getVserverName (char const *id, vcCfgStyle style)`
- `char * vc_getVserverCfgDir (char const *id, vcCfgStyle style)`
- `char * vc_getVserverAppDir (char const *id, vcCfgStyle style, char const *app)`
- `char * vc_getVserverVdir (char const *id, vcCfgStyle style, bool physical)`
- `xid_t vc_getVserverCtx (char const *id, vcCfgStyle style, bool honor_static, bool *is_running)`
- `char * vc_getVserverByCtx (xid_t ctx, vcCfgStyle *style, char const *revdir)`

- `int vc_createSkeleton (char const *id, vcCfgStyle style, int flags)`

6.2.1 Detailed Description

The public interface of the the libvserver library.

Definition in file [vserver.h](#).

6.2.2 Define Documentation

6.2.2.1 `#define VC_DYNAMIC_XID ((xid_t)(-1))`

the value which means a random (the next free) ctx

Definition at line 68 of file [vserver.h](#).

6.2.2.2 `#define VC_NOCTX ((xid_t)(-1))`

the value which is returned in error-case (no ctx found)

Definition at line 65 of file [vserver.h](#).

6.2.2.3 `#define VC_SAMECTX ((xid_t)(-2))`

the value which means the current ctx

Definition at line 70 of file [vserver.h](#).

6.2.3 Typedef Documentation

6.2.3.1 `typedef uint_least64_t vc_limit_t`

The type which is used for a single limit value.

Special values are

- `VC_LIM_INFINITY` ... which is the infinite value
- `VC_LIM_KEEP` ... which is used to mark values which shall not be modified by the `vc_set_rlimit()` operation.

Else, the interpretation of the value depends on the corresponding resource; it might be bytes, pages, seconds or litres of beer.

Definition at line 429 of file vserver.h.

6.2.3.2 an_unsigned_integer_type `xid_t`

The identifier of a context.

Definition at line 290 of file vserver.h.

6.2.4 Function Documentation

6.2.4.1 `int vc_add_dlimit (char const * filename, xid_t xid, uint_least32_t flags)`

Add a disk limit to a file system.

6.2.4.2 `int vc_createSkeleton (char const * id, vcCfgStyle style, int flags)`

Create a basic configuration skeleton for a vserver plus toplevel directories for pkgmanagment and filesystem (when requested).

6.2.4.3 `int vc_get_dlimit (char const * filename, xid_t xid, uint_least32_t flags, struct vc_ctx_dlimit * limits)`

Get a disk limit.

6.2.4.4 `char* vc_getVserverAppDir (char const * id, vcCfgStyle style, char const * app)`

Returns the path of the configuration directory for the given application. The result will be allocated and must be freed by the caller.

6.2.4.5 `char* vc_getVserverByCtx (xid_t ctx, vcCfgStyle * style, char const * revdir)`

Resolves the cfg-path of the vserver owning the given ctx. 'revdir' will be used as the directory holding the mapping-links; when NULL, the default value will be assumed. The result will be allocated and must be freed by the caller.

6.2.4.6 `char* vc_getVserverCfgDir (char const * id, vcCfgStyle style)`

Returns the path of the vserver configuration directory. When the given vserver does not exist, or when it does not have such a directory, NULL will be returned. Else, the result will be allocated and must be freed by the caller.

6.2.4.7 `xid_t vc_getVserverCtx (char const * id, vcCfgStyle style, bool honor_static, bool * is_running)`

Returns the ctx of the given vserver. When vserver is not running and 'honor_static' is false, VC_NOCTX will be returned. Else, when 'honor_static' is true and a static assignment exists, those value will be returned. Else, the result will be VC_NOCTX.

When 'is_running' is not null, the status of the vserver will be assigned to this variable.

6.2.4.8 `char* vc_getVserverName (char const * id, vcCfgStyle style)`

Resolves the name of the vserver. The result will be allocated and must be freed by the caller.

6.2.4.9 `char* vc_getVserverVdir (char const * id, vcCfgStyle style, bool physical)`

Returns the path to the vserver root-directory. The result will be allocated and must be freed by the caller.

6.2.4.10 `bool vc_is_dynamic_xid (xid_t xid)`

Returns true iff *xid* is a dynamic xid

6.2.4.11 `nid_t vc_nidopt2nid (char const *, bool honor_static, char const ** err_info)`

Maps a nid given at '-nid' options to a *nid_t*

6.2.4.12 `int vc_rem_dlimit (char const * filename, xid_t xid, uint_least32_t flags)`

Remove a disk limit from a file system.

6.2.4.13 `int vc_set_dlimit (char const * filename, xid_t xid, uint_least32_t flags, struct vc_ctx_dlimit const * limits)`

Set a disk limit.

6.2.4.14 `xid_t vc_xidopt2xid (char const *, bool honor_static, char const ** err_info)`

Maps an xid given at '-xid' options to an *xid_t*
